Segment Analysis

This Retail Sales Analytics Dashboard provides a comprehensive analysis of sales, customers, and business performance using Power BI. The dashboard helps track key metrics such as Total Sales, Revenue, Orders, Average Order Value, Customer Segments, and Product Performance through interactive visualizations and filters.

The project analyses retail business data across different states, product categories, brands, stores, and customer segments to identify sales trends and business insights. It enables better decision-making by monitoring monthly sales performance, customer behavior, top-selling products, and regional sales distribution.

The dashboard is divided into multiple analytical sections including Sales Analysis, Customer Analysis, Segment Analysis, and Overall Business Overview. Interactive charts, KPI cards, maps, slicers, and drill-down features are used to create a user-friendly and data-driven reporting solution.

This project was developed using Power BI, DAX, data modelling, and visualization techniques to transform raw retail data into meaningful business insights for performance tracking and strategic planning.
